BINF2111 – Introduction to Bioinformatics Computing

BASH 101 - Bash around and find out?

Richard Allen White III, PhD RAW Lab

Lecture 8 - Thursday Sep 14th, 2023

Learning Objectives

- Review quiz and bonus
- Bash variables review
- Bash variables strings
- Sting formats bioinfomatics (fasta, fasta-like files)
- Bash Arrays
- Quiz 8

Bonus 6

In the doppelganger_names.txt count how many times the name 'chi' is left to the name 'bill'

```
Using grep only command:
grep -oE 'chi'$'\t"bill' doppelganger_names.txt | wc -l
grep -cP "chi\tbill" doppelganger_names.txt
```

```
Using grep with printf command:
grep -oE "chi$(printf '\t')bill" doppelganger_names.txt | wc -l
grep -cP "chi\tbill" doppelganger_names.txt | xargs printf "chi comes before bill
%d times.\n"
```

```
Only awk:
awk '/chi\tbill/' doppelganger_names.txt | wc -l
awk "/chi[\t]bill/ {i++} END {print i}" doppelganger_names.txt
```

Quiz 7

printf '#!/bin/bash\n# This is my first comment\n' >script.sh

Output is:

#!/bin/bash

This is my first comment

T or F

Quiz 7

printf '#!/bin/bash\n# This is my first comment\n' >script.sh

Output is:

#!/bin/bash

This is my first comment

T or F

Quiz 7

printf '#!/bin/bash\n# This is my first comment\n' >script.sh

Output of the command to the script:

#!/bin/bash
This is my first comment

Bonus 7

- Write a bash script that states 150 kg at 178 cm is overweight?

ENJOY!

Bonus 7

- Write a bash script that states 150 kg at 178 cm is overweight?

```
1 #!/bin/bash
 3 # This script prints a message about your weight if you give it
  your
 5 # weight in kilos and height in centimeters.
 6
 7 weight="$1"
 8 height="$2"
 9 idealweight=$[$height - 110]
10 if [ Sweight -le Sidealweight ] ; then
11 echo "You should eat a bit more food."
12 else
13 echo "You should eat a bit less food."
14 fi
```

bash -x weight.sh 130 178

BASH Reserved words

BASH Variables (By content)

Apart from dividing variables in local and global variables, we can also divide them in categories according to the sort of content the variable contains.

In this respect, variables come in 4 types:

- String variables
- Integer variables
- Constant variables
- Array variables

Sequence files are in a variety of formats commonly called FASTA format is a text-based format for representing either nucleotide sequences or amino acid (protein) sequences, as single letter codes.

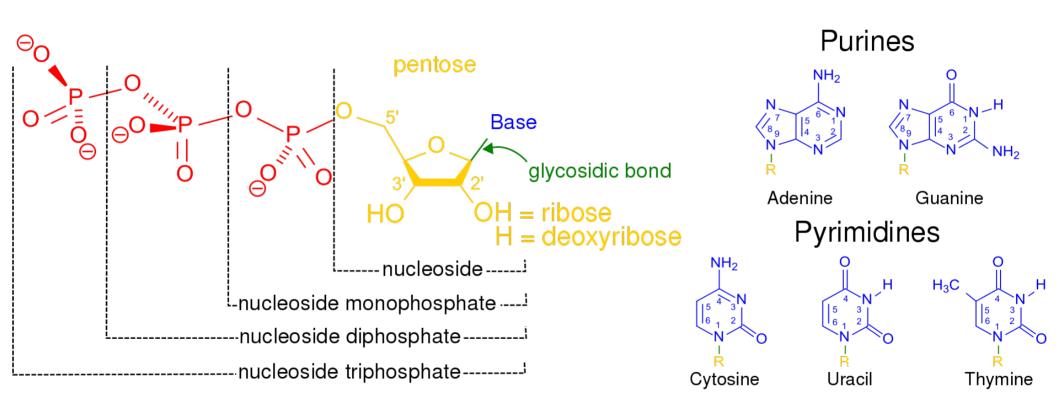

Sequence files are in a variety of formats commonly called FASTA format is a text-based format for representing either nucleotide sequences or amino acid (protein) sequences, as single letter codes.

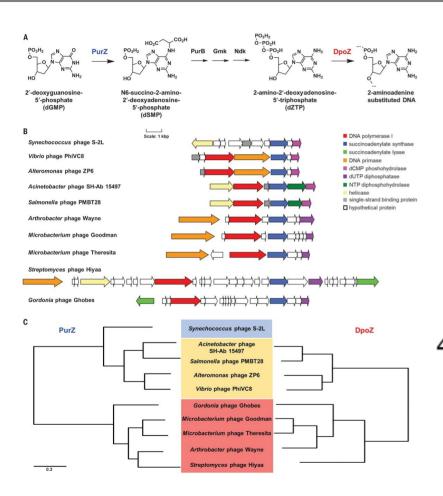

Nucleotides (5 single letters)

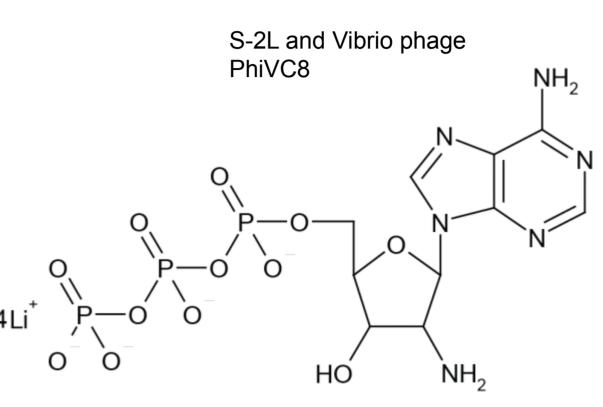

A, T, C, G, U

Guanine (G), adenine (A), cytosine (C) and thymine (T) for DNA.

For RNA, uracil (U) (rarely used)

2-amino-2'-deoxyadenosine-5'-triphosphate (2-amino adenine)

Sequence files - .fa, .fasta, .ffn, .fna

BEST - .fna (fasta nucleotide file - contigs/reads)
.ffa - fasta feature nucleotide (nucleotide for protein ORFs)

Sequence files - .fa, .fasta, .ffn, .fna

BEST - .fna (fasta nucleotide file - contigs/reads)
.ffa - fasta feature nucleotide (nucleotide for protein ORFs)

fna example

```
>Illumina_Single_End_Adapter1
GATCGGAAGAGCTCGTATGCCGTCTTCTGCTTG
>Illumina_Single_End_Adapter2
CAAGCAGAAGACGGCATACGAGCTCTTCCGATCT
>Illumina_Single_End_PCR_Primer1
AATGATACGGCGACCACCGAGATCTACACTCTTTCCCTACACGACGCTCTTCCGATCT
>Illumina_Single_End_PCR_Primer2
CAAGCAGAAGACGGCATACGAGCTCTTCCGATCT
```

Sequence files - .fa, .fasta, .ffn, .fna

>CP001157.1_1 # 101 # 1537 # 1 # **ffa example**

BEST - .fna (fasta nucleotide file - contigs/reads)
.ffa - fasta feature nucleotide (nucleotide for protein ORFs)

Sequence files - .fq, fastq, fasta/qual (rare)

+*"))**55CCF>>>>CCCCCCC65

This is the fasta plus the quality encoded (raw/trim reads)

```
fastq example
@SEQ_ID
GATTTGGGGTTCAAAGCAGTATCGATCAAATAGTAAATCC
ATTTGTTCAACTCACAGTTT
+
!"*((((***+))%%%++)(%%%%).1***
```

Sequence files - .fq, fastq, fasta/qual (rare)

This is the fasta plus the quality encoded (raw/trim reads)

The byte representing quality runs from 0x21 (lowest quality; '!' in ASCII) to 0x7e (highest quality; '~' in ASCII). Here are the quality value characters in left-to-right increasing order of quality (ASCII):

```
!"#$%&'()*+,-./0123456789:;<=>
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvw
xyz{|}~
```

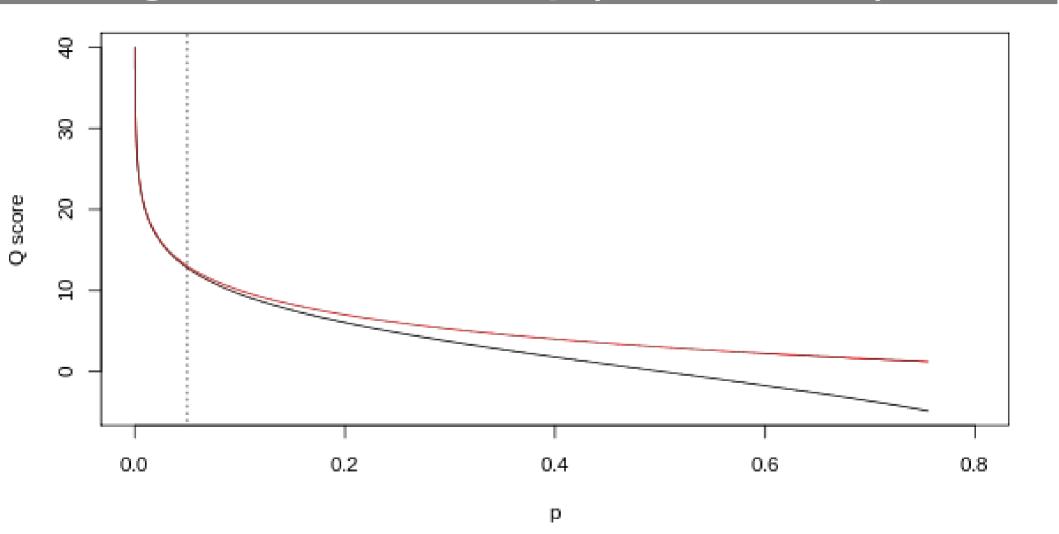

American Standard Code for Information Interchange (ASCII)

A quality value Q is an integer mapping of p (i.e., the probability that the corresponding base call is incorrect). Two different equations have been in use. The first is the standard Sanger variant to assess reliability of a base call, otherwise known as Phred quality score:

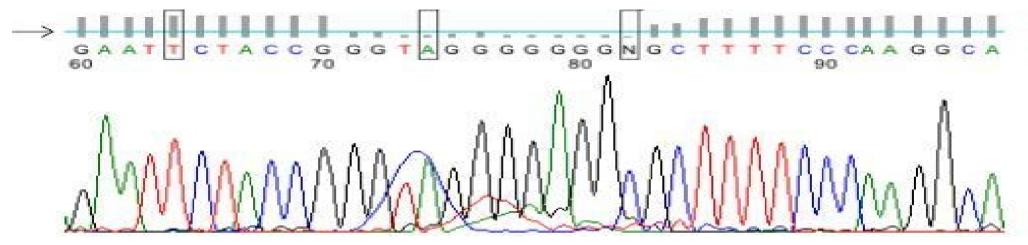

$$\mathbf{Q}$$
 sanger = -10 $\log_{10} p$

Illumina (solexa) Genome Analyzer earlier used a different mapping, encoding the odds p/(1-p) instead of the probability p:

Q solexa (prior to 1.3v) = -10
$$\log_{10} p / 1 - p$$

String Variables – fastq (Phred scores)

Phred quality scores are logarithmically linked to error probabilities

Phred Quality Score	Probability of incorrect base call	Base call accuracy
10	1 in 10	90%
20	1 in 100	99%
30	1 in 1000	99.9%
40	1 in 10,000	99.99%
50	1 in 100,000	99.999%
60	1 in 1,000,000	99.9999%

Sequence files are in a variety of formats commonly called FASTA format is a text-based format for representing either nucleotide sequences or amino acid (protein) sequences, as single letter codes.

Amino Acids (20 single letters, 3 nucleotide = 1 codon) R, H, K, D, E, S, T, N, Q, C, G, P, A, V, I, L, M, F, Y, W

22 possible (hydroxyproline and selenomethionine rare)

```

MKFPDYERVLPRGGDKKVLGDRQLLREAFSRTAILSNEK

>CP001157.1_3 # 2688

*

>CP001157.1 2 # 1566

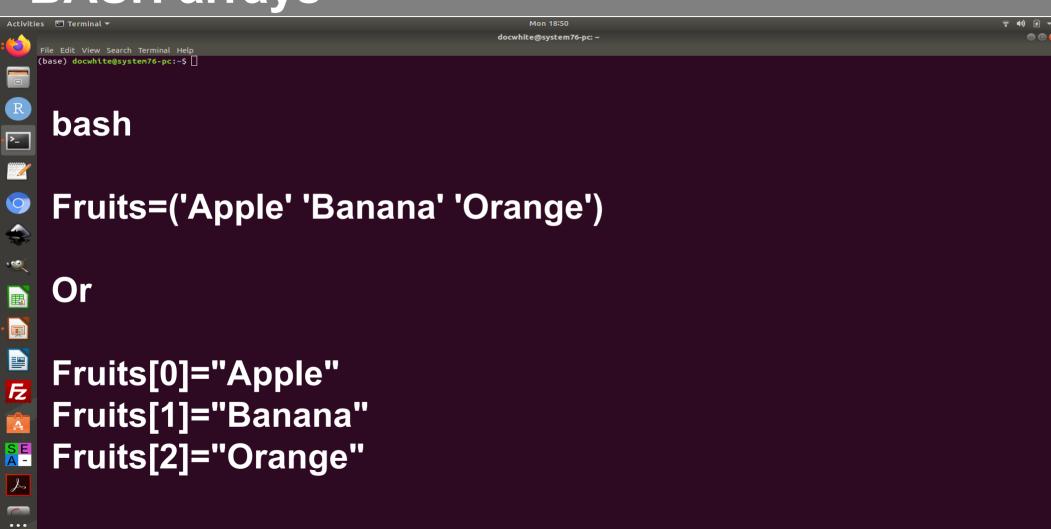

MSLGRVTVTAVRNLHPVTLNPSPRINILYGPNGSGKTSLL*

Array Variables in Bash

An array is a variable containing multiple values. Any variable may be used as an array.

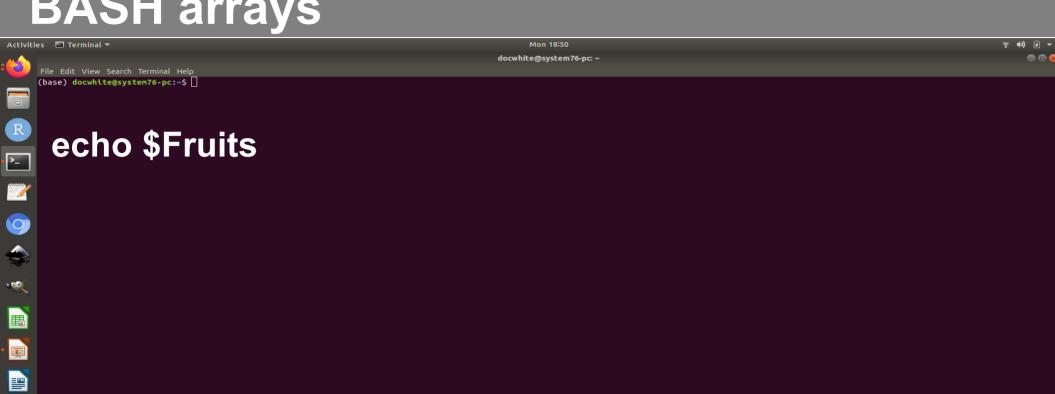

There is no maximum limit to the size of an array, nor any requirement that member variables be indexed or assigned contiguously.

Arrays are zero-based: the first element is indexed with the number 0.
